

We scale the morph based on a reference vertex (#3127),
in order to remove base of neck offset relative to G8F

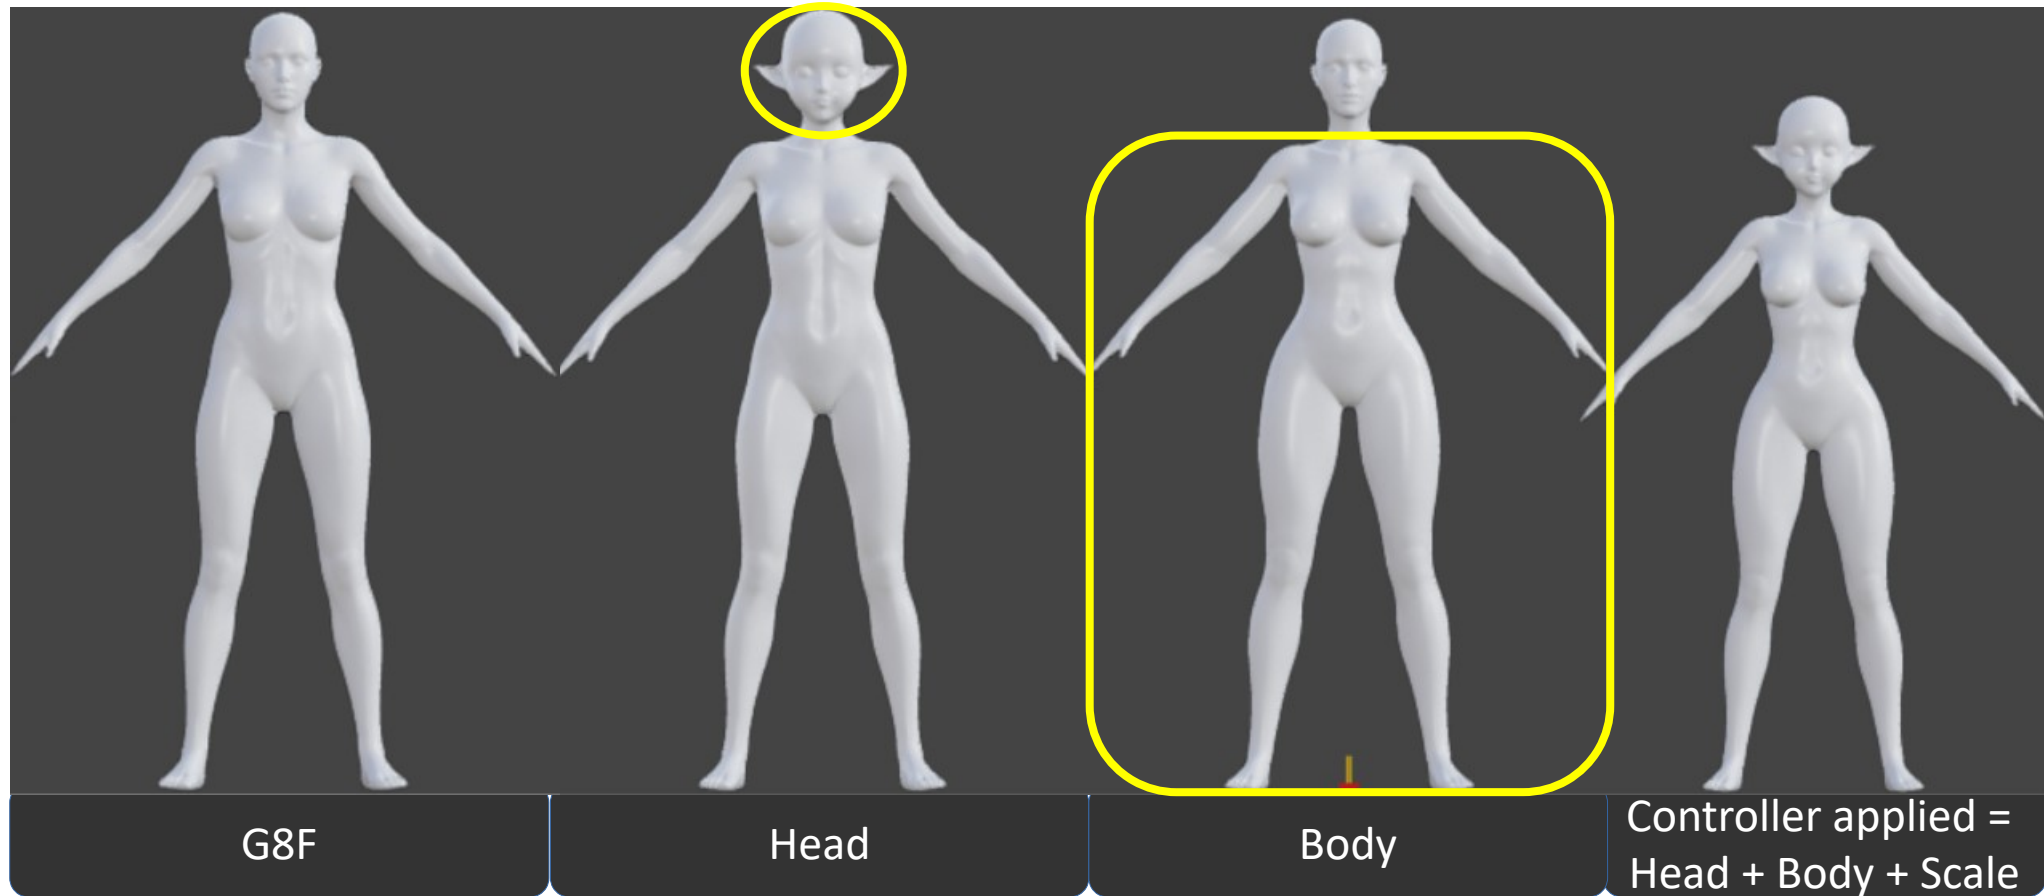

- ❖ Compute deltas only for the head
- ❖ Adjust rigging to shape, freeze properties & save as a morph asset

- ❖ Compute deltas only for the body
- ❖ Adjust rigging to shape, freeze properties & save as a morph asset

- ❖ Apply the scaled morphs (head & body) and reset figure scale to its initial value
- ❖ Freeze properties & save as a morph asset

There are 2 main advantages to this method :

- ✓ its simplicity
- ✓ it generates 'normalized' shapes that blend well with most characters that have 'standard' proportions
